Executive Summary

The **Superstore Sales Performance Dashboard** was developed using **Google Looker Studio** to analyze a sample retail sales dataset. The dashboard provides an overview of sales, profit, customer orders, product performance, delivery methods, and regional distribution between **2011 and 2014**. It enables users to monitor key business metrics and identify sales trends through interactive visualizations and KPI scorecards.

Key Findings

- The company generated **$2.30 million** in total sales during the analysis period.
- Total profit reached **$286.40 thousand**, indicating overall profitable operations.
- A total of **5,009 customer orders** were processed, serving **793 unique customers**.
- Approximately **37,873 units** were sold across multiple product categories.
- Sales increased steadily over the four-year period, with **2014 recording the highest annual sales**.
- **Standard Class** was the most frequently used delivery method, accounting for the largest share of customer orders.
- The **West** region contributed the highest proportion of total orders, followed by the East region.
- Among all product categories, **Technology** generated the highest profit, while **Furniture** contributed the lowest profit.

Conclusion

The dashboard effectively summarizes key retail performance indicators using a sample sales dataset. By combining KPI scorecards with charts for sales trends, delivery methods, regional performance, product profitability, and geographic distribution, the dashboard demonstrates how Google Looker Studio can be used to transform raw transactional data into meaningful business insights. This project highlights essential dashboard development and data visualization skills suitable for business intelligence and data analytics applications.
